Question 1: Forward Propagation & Structure

Q: How do Recurrent Neural Networks (RNNs) handle sequential input data of varying lengths during forward propagation?

Question 2: Shared Parameters

Q: When an RNN is unrolled across multiple time steps, what happens to the weights and biases?

Question 3: Exploding Gradient Problem

Q: During backpropagation over many time steps, what causes the gradient to "explode," and how does this affect training?

Question 4: Vanishing Gradient Problem

Q: What causes the "vanishing gradient" problem during backpropagation through time, and what issue does it create?

Question 5: Sequential Information Flow

Q: In forward propagation, why are inputs fed sequentially from oldest to newest data points?
